Treatments For Dog Incontinence

[Dog incontinence](#) --is this problem affecting your favorite friend? You may be unpleasantly surprised by puddles of urine showing up in your home. You have unhappily discovered that your long-time friend is dribbling urine and can't seem to control it. You know when he's around because you can smell him.

Many dog owners don't realize that dog urinary incontinence is usually not difficult to treat. If your dog is showing signs of this problem, you need to take him to the vet for a check-up.

What Causes Dog Bladder Control Problems?

- Dog bladder infection
- Drinking too much water
- Weak bladder sphincter

Dog Bladder Infection

Female dogs are much more likely to develop bladder infections than males. This is because the urethra is shorter and broader in females, which allows bacteria easier access to the urinary tract.

Your vet may want to do a urine culture to determine exactly what is causing the infection. Nearly every [dog bladder infection](#) is caused by E. coli or staph, although a few may be caused by a fungal infection. This will guide your vet in choosing the best antibiotic for your dog's condition.

If your dog bladder control problems are being caused by a canine urinary tract infection, the problem will end as soon as the infection is cured. However, you need to be sure to give your dog the full antibiotic course to keep the infection from coming back.

Drinking Too Much Water

Although it sounds obvious, a dog that drinks too much water will probably have trouble controlling his bladder. He just can't hold it long enough to get outside.

Why would a dog drink too much water? There can be several reasons:

- Diabetes
- Cushing's Syndrome
- Kidney failure

If you notice that your dog is drinking excessive amounts of water, it's important to take your dog for a vet check-up to check for these conditions.

Weak Bladder Sphincter

This sometimes happens as your dog gets older. The muscles in the sphincter don't tighten and close as well as they did when your dog was younger, which leads to urine dribbling. If your dog is overweight, this can compound the problem.

Your vet may treat this condition with hormone therapy. Male dogs are given testosterone, while females receive estrogen. Another treatment is a drug that stimulates the nerves in the sphincter muscles. If necessary, these two treatments can be combined.

Do Natural Remedies For Dog Urinary Incontinence Work?

Conventional medicine treats just the symptoms, not the root cause of the problem. Holistic medicine has as a basic premise the idea that your pet naturally maintains a healthy balance in his body that helps him to resist disease. If this balance is upset, your dog gets sick.

Holistic medicine looks at your dog as a whole, not as a urinary tract, or a digestive system, or a nervous system. Natural remedies for dogs work by stimulating your pet's immune system so he's able to fight off infections better. Instead of just treating the symptoms, herbal and homeopathic remedies work to heal the underlying cause of the problem.

People are becoming more careful about the drugs they take, and it's to be expected that they'll take extra care with their pets, too. Herbal and homeopathic remedies for dog incontinence are safe and effective, with no risk of side effects. They're also inexpensive and readily available.
